## Physics of Sound Worksheet Answer Key

## Useful equations

$$
\begin{array}{cc}
f=\frac{v}{\lambda} & f=\frac{1}{T} \quad \beta(d B)=10 \log \left(\frac{I}{I_{0}}\right) \\
f=\text { frequency } & \lambda=\text { wavelength } \quad T=\text { period } \\
v=\text { wave velocity } & \beta(d B)=\text { sound intensity } \\
I_{0}=10^{-12} \frac{\text { watts }}{m^{2}} I_{0}, \text { reference intensity, is the standard threshold of hearing intensity }
\end{array}
$$

## 1. How does sound move through different media?

Sound travels through media by vibrating molecules in the matter. Closely packed molecules, like in solids, transfer sound faster than loosely packed molecules, like in liquids and gases.
2. Calculate the wave velocity of the given wave.
$\lambda=4 \mathrm{~mm}$
$f=\frac{v}{\lambda} \quad \mathrm{f}=1 / 4$ seconds $\mathrm{v}=(1 / 4$ seconds $) \times 4 \mathrm{~mm}=1 \mathrm{~mm} /$ second

$\qquad$ Date $\qquad$ Class $\qquad$
3. A soundwave hits a wall at a rate of 32.2 Hz .
a. What is the period of the wave?

$$
\begin{aligned}
& f=1 / t \quad t=\text { period } \quad 32.2 \mathrm{~Hz}=32.2 \text { seconds }^{-1} \\
& \text { period }=1 / 32.2 \text { seconds }=.031 \text { seconds }
\end{aligned}
$$

b. Calculate the speed of the wave if the distance between wave crests is $\mathbf{1 2}$ meters.
$f=\frac{v}{\lambda} \quad \lambda=12 \mathrm{~m} \quad \mathrm{v}=12 \mathrm{~m} \times 32.2 \mathrm{~Hz}=386.4 \mathrm{~m} / \mathrm{s}$
4. The speed of sound at room temperature is $346 \mathrm{~m} / \mathrm{s}$.
a. What is the frequency of a wave with a wavelength of 2.5 mm ?

$$
\begin{aligned}
& f=\frac{v}{\lambda} \\
& \lambda=0.0025 \mathrm{~m} \quad \mathrm{v}=346 \mathrm{~m} / \mathrm{s} \quad \mathrm{f}=346 \mathrm{~m} / \mathrm{s} \div 0.0025 \mathrm{~m}=138400 \mathrm{~Hz}
\end{aligned}
$$

b. What is the period?

$$
t=\text { period } \quad f=1 / t \quad t=1 / 138400 \mathrm{~Hz}=7.2 \times 10^{-6} \text { seconds }
$$

5. A quiet library has a sound intensity of $1 \times 10^{-8} \mathrm{~W} / \mathrm{m}^{2}$
a. Calculate the sound intensity in dB.

$$
\begin{aligned}
& \beta(d B)=10 \log \left(\frac{I}{I_{0}}\right) \quad I_{0}=10^{-12} \frac{\text { watts }}{m^{2}} \\
& \beta=10 \log \left(1 \times 10^{-8} \mathrm{~W} / \mathrm{m}^{2} \div 1 \times 10^{-12} \mathrm{~W} / \mathrm{m}^{2}\right)=40 \mathrm{~dB}
\end{aligned}
$$

b. What is the threshold of pain?

140 dB
