

## Foundations Math Worksheet **Answers**

1. Compare the *actual* bearing pressure that the shallow foundation produces and the *allowable* bearing pressure of the soil. Does the foundation fail? Why is  $\sigma_{zD}$  equal to 0? Show all your work and calculations.

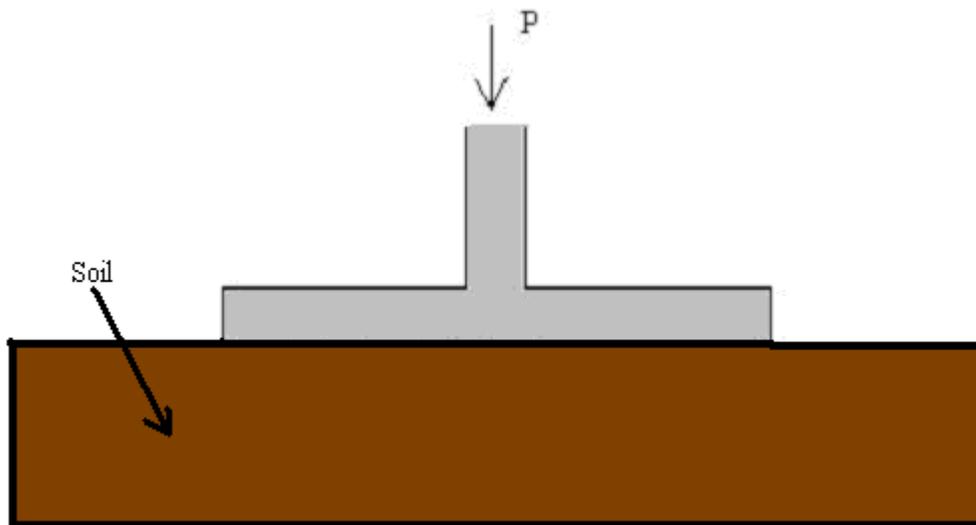

**Actual bearing pressure** is  $q = \text{force} \div \text{area}$

The force,  $P$ , on the foundation is 100,000 lbs

The area of the bottom of the foundation is square with 10-foot sides

**Allowable bearing pressure** of the soil is  $q_{ult} = 6.28 \times s_u + \sigma_{zD}$

From soil investigations,  $s_u = 500 \text{ lbs/ft}^2$  and  $\sigma_{zD}$  is 0.

**Answer**

$$q = 100,000 \text{ lbs} \div (10 \text{ feet} \times 10 \text{ feet}) = 1000 \text{ lbs/ft}^2$$

$$q_{ult} = 6.28 \times 500 \text{ lbs/ft}^2 + 0 = 3140 \text{ lbs/ft}^2$$

The foundation does not fail because  $q < q_{ult}$

$\sigma_{zD}$  is 0 because the foundation is on top of the soil and not embedded into the soil

2. Compare the *actual* bearing pressure that the shallow foundation produces and the *allowable* bearing pressure of the soil. Does the foundation fail? Show all your work and calculations.

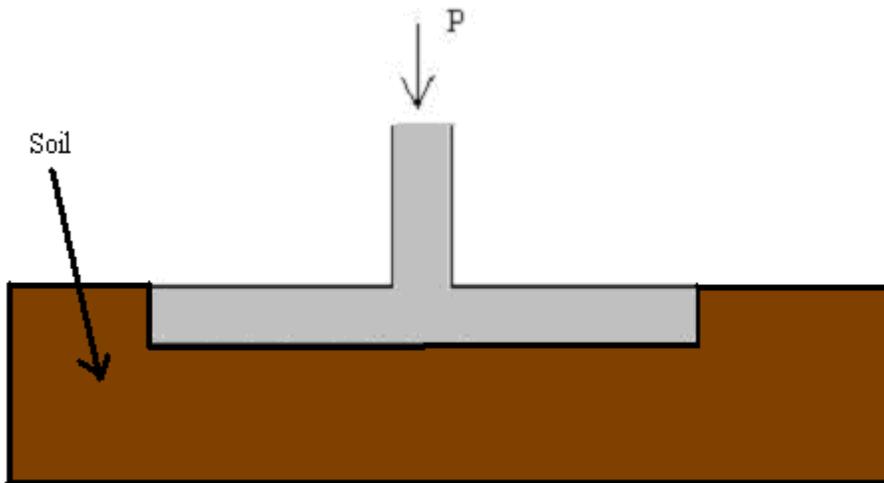

**Actual bearing pressure** is  $q = \text{force} \div \text{area}$

The force,  $P$ , on the foundation is 200,000 lbs

The area of the bottom of the foundation is square with 7-foot sides

**Allowable bearing pressure** of the soil is  $q_{ult} = 6.28 \times s_u + \sigma_{zD}$

From soil investigations,  $s_u = 500 \text{ lbs/ft}^2$  and  $\sigma_{zD}$  is  $110 \text{ lbs/ft}^2$

**Answer**

$$q = 200,000 \text{ lbs} \div (7 \text{ feet} \times 7 \text{ feet}) = 4082 \text{ lbs/ft}^2$$

$$q_{ult} = 6.28 \times 500 \text{ lbs/ft}^2 + 110 = 3250 \text{ lbs/ft}^2$$

The foundation fails because  $q > q_{ult}$

**3. Compare the *actual* load given for the deep foundation and the *allowable* ultimate load calculated. Does the foundation fail? Show all your work and calculations.**

The **actual** load,  $P$ , on the foundation is 100,000 lbs

The **allowable** load  $P_a = q_t' \times A_t + f_s \times A_s$ .

The area of the bottom of the foundation is circular with a 1-foot radius

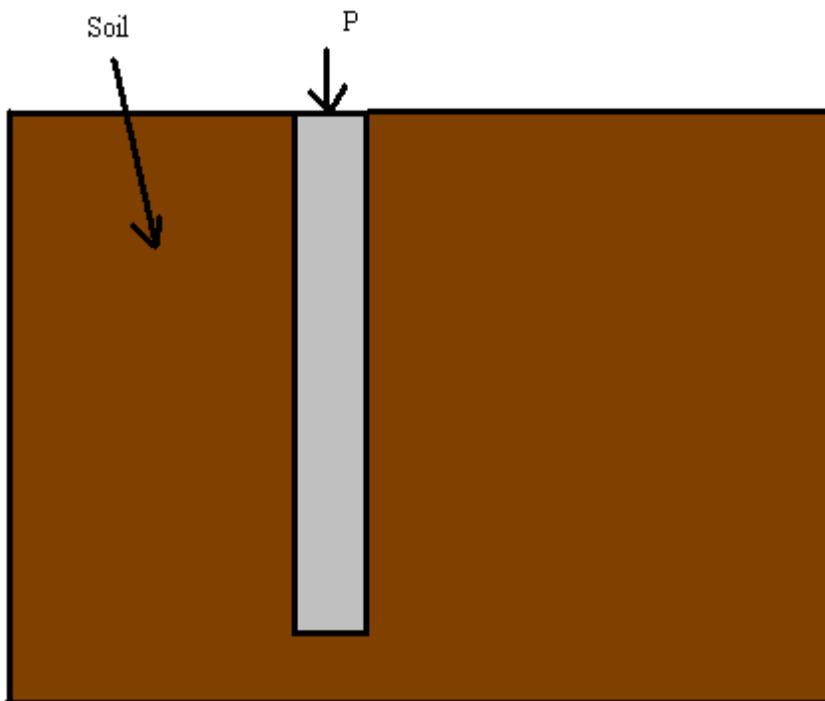

Area of a circle =  $\pi \times \text{radius} \times \text{radius}$

The area of the side of the foundation is the surface area of the foundation in contact with the soil. The area is the foundation circumference of the multiplied by the foundation length.

Circumference =  $2 \times \pi \times \text{radius}$        $\pi = 3.14$

Length of the foundation = 40 feet

From soil investigations,  $q_t' = 3000 \text{ lbs/ft}^2$  and  $f_s = 600 \text{ lbs/ft}^2$

**Answer**

$$P_a = q_t' \times A_t + f_s \times A_s = 3000 \text{ lbs/ft}^2 * (3.14 \times 1\text{ft} \times 1 \text{ft}) + 600 \text{ lbs/ft}^2 * (2 \times 3.14 \times 1 \text{ft} \times 40 \text{ft})$$

$$P_a = 160,140 \text{ lbs}$$

**The foundation does not fail because  $P < P_a$ .**
