## Wind Power! Math Worksheet

1. What is the power produced by a wind generator that produces 500 J of electrical energy in 2 seconds?
Use $P=E \div t$
where $P=$ power $(W), E=$ energy $(J)$ and $t=$ time in seconds.
$E=$ $\qquad$ J
$\mathrm{t}=$ $\qquad$ seconds
$\mathrm{E} \div \mathrm{t}=$ $\qquad$ W
This is the power $(\mathrm{P})$ produced.
2. How much electrical energy is produced in 3 seconds by a wind generator that has a power out of 1000 W ?
Use. $\mathbf{E}=\mathbf{P} \mathbf{x}$ t
$\mathrm{P}=$ $\qquad$ W
$\mathrm{T}=$ $\qquad$ seconds

Pxt= $\qquad$ J

This is the energy ( E ) produced.
3. A large wind generator has a power output of 500 W . How long does it take to produce 500 J of electrical energy?
Use $\mathbf{t}=\mathbf{E} \div \mathbf{P}$

$$
\begin{array}{ll}
\mathrm{E}=\square \mathrm{J} \\
\mathrm{P}=\square
\end{array}
$$

$\mathrm{E} \div \mathrm{P}=$ $\qquad$ seconds
This is the time in seconds that it takes.
