## Kinetic Movement Worksheet

In your group, choose one person to be the test subject, another to watch the scale, and another to record measurements and values.

## Walking

1. Measure the mass of the test subject (in kg ).

$$
m=60 \mathrm{~kg}
$$

2. Have the test subject walk across the scale.
a. What is the maximum weight recorded?

$$
\mathrm{W}=\mathbf{1 2 0} \mathrm{N}
$$

b. Calculate the maximum force exerted on the scale, using Newton's second law.

$$
\begin{aligned}
& \mathrm{F}=\mathrm{m} * \mathrm{a}=\mathrm{m} * \mathrm{~g} \\
& \mathrm{~F}=120 \mathrm{~kg} * 9.8 \mathrm{~m} / \mathrm{s} \\
& \mathrm{~F}=1176 \mathrm{~N}
\end{aligned}
$$

3. Assuming that the impact of the foot with the ground takes 0.02 seconds, calculate the impulse of the step.

$$
\begin{aligned}
& I=\mathbf{F} * \mathrm{t} \\
& \mathrm{I}=1176 \mathrm{~N} * 0.02 \mathrm{~s} \\
& \mathrm{I}=\mathbf{2 4 N} \mathrm{N}
\end{aligned}
$$

4. Calculate the impact velocity of the shoe with the ground.

$$
\begin{aligned}
& \mathbf{I}=\mathbf{m} * \Delta \mathbf{v} \\
& \Delta \mathbf{v}=\mathbf{I} / \mathrm{m} \\
& \Delta \mathbf{v}=24 \mathrm{~N} * \mathrm{~s} / 60 \mathrm{~kg} \\
& \Delta \mathbf{v}=0.4 \mathrm{~m} / \mathrm{s}
\end{aligned}
$$

## Running

1. Have the test subject jog across the scale. What is the maximum massweight recorded (in kg )?

$$
W=240 \mathrm{~kg}
$$

2. Calculate the maximum force using Newton's second law.

How does this force compare to that of walking?

$$
\begin{aligned}
& \mathrm{F}=\mathrm{m} * \mathrm{a}=\mathrm{m} * \mathrm{~g} \\
& \mathrm{~F}=240 \mathrm{~kg} * 9.8 \mathrm{~m} / \mathrm{s} \\
& \mathrm{~F}=2,352 \mathrm{~N}
\end{aligned}
$$

3. Assuming that the impact takes 0.02 seconds, calculate the impulse of the step.

$$
\begin{aligned}
& \mathrm{I}=\mathbf{F} * \mathrm{t} \\
& \mathrm{I}=2,352 \mathrm{~N} * 0.02 \mathrm{~s} \\
& \mathrm{I}=47 \mathrm{~N} * \mathrm{~s}
\end{aligned}
$$

4. Calculate the impact velocity of the shoe with the ground. How does the impact velocity compare to that of walking?

$$
\begin{aligned}
& \Delta v=I / \mathrm{m} \\
& \Delta v=47 \mathrm{~N} * \mathrm{~s} / 60 \mathrm{~kg} \\
& \Delta v=0.78 \mathrm{~m} / \mathrm{s}
\end{aligned}
$$
