# Bioluminescent Organism Cards

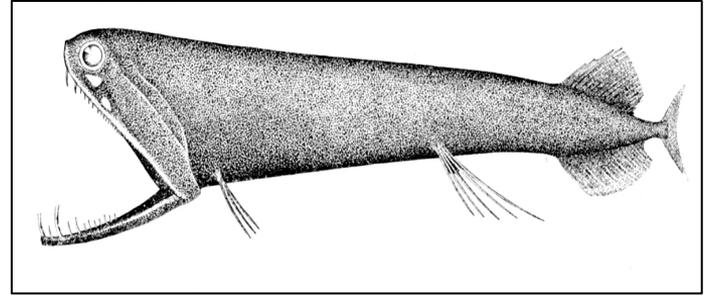

## Teacher Instructions:

- **Print cards (the full slides) front to back. This will result in the organism picture on the front and the organism's information on the back.**
- **Have students work in pairs.**
- **Students can pick an organism, the teacher can assign organisms to students based on their level, or students can draw for an organism.**
- **Students read about their organism and learn how they use bioluminescence to help them survive (for example, to warn and evade predators, to lure and detect prey, or to communicate between members of the same species.)**
- **Students select the appropriate cut-out of their organism and then use the prototype design worksheet to plan their design.**

**Deep-Sea Anglerfish**  
Consumer, Carnivore

**Stoplight Loosejaw**  
Consumer, Carnivore

**Spined Pygmy Shark**  
Consumer, Carnivore

**Jewel Squid**  
Consumer, Carnivore

## **Deep-Sea Anglerfish**

**Consumer, Carnivore**

**What it is: bony fish containing fang-like teeth that has a unique mode of predation involving a modified fin ray**

**What it eats: shrimp, fish, crustaceans**

**Depth: 2,000 meters**

**Bioluminescent use: modified luminescent fin ray acts a lure for prey; luminescence comes from bacteria in seawater**

## **Stoplight Loosejaw**

**Consumer, Carnivore**

**What it is: small, deep-sea dragonfish with an unusual open structure of its jaw that produces red bioluminescence near its eyes**

**What it eats: small fish and crustaceans**

**Depth: 500 - 4,000 meters**

**Bioluminescent use: shines "invisible" red light (stoplight) on prey; searching for undetectable food with an invisible beam of light**

## **Spined Pygmy Shark**

**Consumer, Carnivore**

**What it is: small shark with long snout and large eyes; participates in vertical migrations to search for food depending on the time of day**

**What it eats: small bony fish, squid**

**Depth: 200 - 500 meters**

**Bioluminescent use: use photophores to match ambient light conditions to camouflage itself from predators**

## **Jewel Squid**

**Consumer, Carnivore**

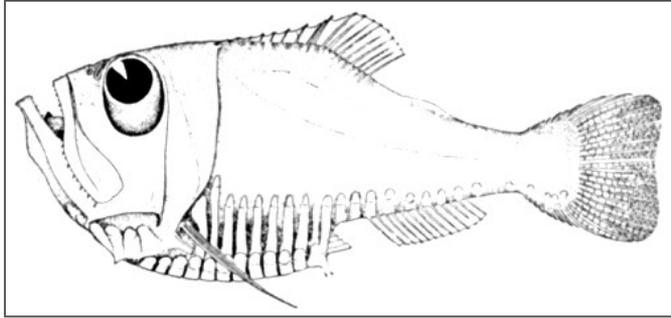

**What it is: also known as the cock-eyed squid because its right eye is small and used for detecting prey and its left eye bulges out at twice the diameter; larger eye used for sight**

**What it eats: fish, crustaceans, shrimp, other squids**

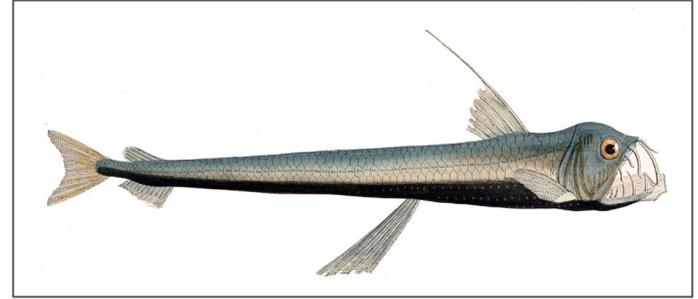

**Depth: 200 - 1,000 meters**

**Bioluminescent use: uses smaller eye to detect bioluminescence from prey animals**

**Hatchetfish**  
Consumer, Carnivore

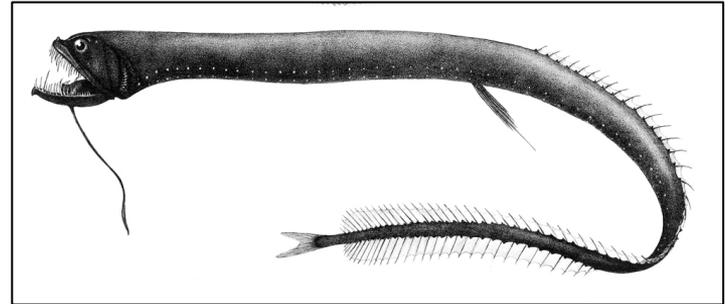

**Sloane's Viperfish**  
Consumer, Carnivore

**Mauve Stinger**  
Consumer, Carnivore

**Black Dragonfish**  
Consumer, Carnivore

## **Hatchetfish**

**Consumer, Carnivore**

**What it is:** deep sea fish that resembles the unique shape of a hatchet; they have tubular eyes that point upward to help them search for food falling from above

**What it eats:** plankton, crustaceans, and tiny fish

**Depth:** 200–1,000 meters

**Bioluminescent use:** light organs emit blue light and point downward to hide from predators through the process of counterillumination; Hatchetfish can adjust the intensity to make them invisible with the light above

## **Mauve Stinger**

**Consumer, Carnivore**

**What it is:** jellyfish that catches prey in tentacles using poisonous stinging cells; also known as the purple-striped jellyfish

**What it eats:** zooplankton, crustaceans, fish eggs and larvae

**Depth:** 150 - 1,400 meters

**Bioluminescent use:** attracts food; light stimulating cells glow when stimulated

## **Sloane's Viperfish**

**Consumer, Carnivore**

**What it is:** toothy dragonfish that can form a cage with its enormous teeth to trap prey by unhinging its jaw up to 90 degrees to catch prey up to 63% of its body size

**What it eats:** small fish and shrimp

**Depth:** 500 - 2,500 meters

**Bioluminescent use:** two rows of light flash in complex patterns to communicate with one another; light can also be used to trick or illuminate their prey or to confuse potential predators

## **Black Dragonfish**

**Consumer, Carnivore**

**What it is:** slender deep-sea fish that

**What it eats:** plankton, algae, shrimp, squid, and other marine invertebrates

**Depth:** 2,000 meters

**Bioluminescent use:** light emitting organs on lower part of its body and below its eye help it avoid predators through deceptive illumination; fleshy part growing from chin lures curious prey
