# Life-Cycle Assessment GROUP Worksheets Answer Key ~Environmental Impact of Cupcakes~ 

## Stage 1: Wet Ingredients

## Inventory Analysis

Each component used to make a cupcake has its own life cycle of production, use and waste. You will collect the values for the energy used and greenhouse gases (GHG) emitted during the production phase of each ingredient. From the ingredient cards, gather the data of each item needed to make cupcakes for your assigned stage. The information you gather should be enough to make $\mathbf{1 2}$ cupcakes.

Data Collection and Calculations

| You need: |  |  | Calculate This: |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Item | Amount | Unit | Energy Used | Unit | GHG emissions | Unit |
| Egg | 2 | egg | 4000 | kJ | 600 | $\mathrm{~g} \mathrm{CO}_{2 \mathrm{e}}$ |
| Milk | 120 | ml | 600 | kJ | 144 | $\mathrm{~g} \mathrm{CO}_{2 \mathrm{e}}$ |
| Butter | 120 | ml | 3960 | kJ | 480 | $\mathrm{~g} \mathrm{CO}_{2 \mathrm{e}}$ |
| Vanilla | 2.5 | ml | 10 | kJ | 10 | $\mathrm{~g} \mathrm{CO}_{2 \mathrm{e}}$ |
| TOTAL |  |  |  |  |  |  |
| 8,570 | kJ | $\mathbf{1 , 2 3 4}$ | $\mathrm{g} \mathrm{CO}_{2 \mathrm{e}}$ |  |  |  |

Use the space below to calculate the energy used and GHG emissions for each ingredient.
Example: 1 egg needs 2000 kJ energy and you need 2 eggs: Energy used $=2 \times 2000 \mathrm{~kJ}=4000 \mathrm{~kJ}$

Egg: 2 eggs $\times \frac{2000 \mathrm{~kJ}}{1 \text { egg }}=4000 \mathrm{~kJ}$
Milk: $120 \mathrm{ml} \times \frac{50 \mathrm{~kJ}}{10 \mathrm{ml}}=600 \mathrm{~kJ}$
Butter: $120 \mathrm{ml} \times \frac{330 \mathrm{~kJ}}{10 \mathrm{ml}}=3960 \mathrm{~kJ}$
Vanilla: $2.5 \mathrm{ml} \times \frac{4 \mathrm{~kJ}}{1 \mathrm{ml}}=10 \mathrm{~kJ}$

2 eggs $\times \frac{300 \mathrm{~g} \mathrm{CO}}{2 e}\left(\mathrm{egg}=600 \mathrm{~g} \mathrm{CO}_{2 e}\right.$
$120 \mathrm{ml} \times \frac{12 \mathrm{~g} \mathrm{CO}_{2 e}}{10 \mathrm{ml}}=144 \mathrm{~g} \mathrm{CO}_{2 e}$
$120 \mathrm{ml} \times \frac{40 \mathrm{~g} \mathrm{CO}_{2 e}}{10 \mathrm{ml}}=480 \mathrm{~g} \mathrm{CO}_{2 e}$
$2.5 \mathrm{ml} \times \frac{4 \mathrm{~g} \mathrm{CO}_{2 e}}{10 \mathrm{ml}}=10 \mathrm{~g} \mathrm{CO}_{2 e}$

Total energy: $4000 \mathrm{~kJ}+600 \mathrm{~kJ}+3960 \mathrm{~kJ}+10 \mathrm{~kJ}=8,570 \mathrm{~kJ}$
Total emissions: $600 \mathrm{~g} \mathrm{CO}_{2 \mathrm{e}}+144 \mathrm{~g} \mathrm{CO}_{2 \mathrm{e}}+480 \mathrm{~g} \mathrm{CO}_{2 \mathrm{e}}+10 \mathrm{~g} \mathrm{CO}_{2 \mathrm{e}}=1,234 \mathrm{~g} \mathrm{CO}_{2 \mathrm{e}}$
$\qquad$ Date: $\qquad$

## Stage 2: Dry Ingredients

## Inventory Analysis

Each component used to make a cupcake has its own life cycle of production, use and waste. You will collect the values for the energy used and greenhouse gases (GHG) emitted during the production phase of each ingredient. From the ingredient cards, gather the data of each item needed to make cupcakes for your assigned stage. The information you gather should be enough to make 12 cupcakes.

Data Collection and Calculations

| You need: |  |  | Calculate This: |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Item | Amount | Unit | Energy Used | Unit | GHG emissions | Unit |  |  |  |  |  |
| Flour | 210 | g | 231 | kJ | 231 | $\mathrm{~g} \mathrm{CO}_{2 \mathrm{e}}$ |  |  |  |  |  |
| Sugar | 230 | g | 2300 | kJ | 207 | $\mathrm{~g} \mathrm{CO}_{2 \mathrm{e}}$ |  |  |  |  |  |
| Baking powder | 6 | g | 45 | kJ | 4.5 | $\mathrm{~g} \mathrm{CO}_{2 \mathrm{e}}$ |  |  |  |  |  |
| Total |  |  |  |  |  |  |  |  |  |  |  |
| $\mathbf{2 , 5 7 6}$ |  |  |  |  |  |  |  |  | kJ | 442.5 | $\mathbf{g ~ C O}_{2 \mathrm{e}}$ |

Use this space to calculate the energy used and GHG emissions for each item.
Example: 1 egg needs 2000 kJ energy and you need 2 eggs: Energy used $=2 \times 2000 \mathrm{~kJ}=4000 \mathrm{~kJ}$

Flour: $210 g \times \frac{11 \mathrm{~kJ}}{10 \mathrm{~g}}=231 \mathrm{~kJ}$
Sugar: $230 g \times \frac{100 \mathrm{~kJ}}{10 \mathrm{~g}}=2300 \mathrm{~kJ}$
Baking powder: $6 g \times \frac{7.5 \mathrm{~kJ}}{1 \mathrm{~g}}=45 \mathrm{~kJ}$
Total energy: $231 \mathrm{~kJ}+2300 \mathrm{~kJ}+45 \mathrm{~kJ}=2576 \mathrm{~kJ}$

Total emissions: $231 \mathrm{~g} \mathrm{CO}_{2 \mathrm{e}}+207 \mathrm{~g} \mathrm{CO}_{2 \mathrm{e}}+4.5 \mathrm{~g} \mathrm{CO}_{2 \mathrm{e}}=442.5 \mathrm{~g} \mathrm{CO}_{2 \mathrm{e}}$
$\qquad$ Date: $\qquad$

## Stage 3: Baking Materials

## Inventory Analysis

Each component used to make a cupcake has its own life cycle of production, use and waste. You will collect the values for the energy used and greenhouse gases (GHG) emitted during the production phase of each ingredient. From the ingredient cards, gather the data of each item needed to make cupcakes for your assigned stage. The information you gather should be enough to make 12 cupcakes.

Data Collection and Calculations

| You need: |  |  | Calculate This: |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Item | Amount | Unit | Energy Used | Unit | GHG emissions | Unit |
| Paper liner | 12 | liner | 240 | kJ | 12 | $\mathrm{g} \mathrm{CO}_{2 \mathrm{e}}$ |
| Metal cupcake tray | 1 | tray | 2600 | kJ | 2200 | $\mathrm{g} \mathrm{CO}_{2 \mathrm{e}}$ |
| Metal mixing bowl | 1 | bowl | 1100 | kJ | 1000 | $\mathrm{g} \mathrm{CO}_{2 \mathrm{e}}$ |
|  |  | Total | 3,940 | kJ | 3,212 | $\mathrm{g} \mathrm{CO}_{2 \mathrm{e}}$ |

Use this space to calculate the energy used and GHG emissions for each item.
Example: 1 egg needs 2000 kJ energy and you need 2 eggs: Energy used $=2 \times 2000 \mathrm{~kJ}=4000 \mathrm{~kJ}$
Paper liner: 12 liners $\times \frac{20 \mathrm{~kJ}}{1 \text { liner }}=240 \mathrm{~kJ}$
12 liners $\times \frac{1 g^{2 l} O_{2 e}}{1 \text { liner }}=12 g \mathrm{CO}_{2 e}$

Total energy: $240 \mathrm{~kJ}+2600 \mathrm{~kJ}+1100 \mathrm{~kJ}=3940 \mathrm{~kJ}$
Total emissions: $12 \mathrm{~g} \mathrm{CO}_{2 \mathrm{e}}+2200 \mathrm{~g} \mathrm{CO}_{2 \mathrm{e}}+1000 \mathrm{~g} \mathrm{CO}_{2 \mathrm{e}}=3212 \mathrm{~g} \mathrm{CO}_{2 \mathrm{e}}$
$\qquad$ Date: $\qquad$

## Stage 4: Oven Baking

## Inventory Analysis

Each component used to make a cupcake has its own life cycle of production, use and waste. You will collect the values for the energy used and greenhouse gases (GHG) emitted during the production phase of each ingredient. From the ingredient cards, gather the data of each item needed to make cupcakes for your assigned stage. The information you gather should be enough to make $\mathbf{1 2}$ cupcakes.

Data Collection and Calculations

| You need: |  |  | Calculate This: |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Item | Amount | Unit | Energy Used | Unit | GHG emissions | Unit |
| Electricity $\left(177^{\circ} \mathrm{C}\right)$ | 20 | minute | 2400 | kJ | 360 | $\mathrm{~g} \mathrm{CO}_{2 \mathrm{e}}$ |

Use this space to calculate the energy used and GHG emissions for each item.
Example: 1 egg needs 2000 kJ energy and you need 2 eggs: Energy used $=2 \times 2000 \mathrm{~kJ}=4000 \mathrm{~kJ}$
Electricity: 20 minutes $\times \frac{7200 \mathrm{~kJ}}{60 \text { minutes }}=2400 \mathrm{~kJ} \quad 20$ minutes $\times \frac{1080 \mathrm{~g} \mathrm{CO}}{60 \text { minutes }}=360 \mathrm{~g} \mathrm{CO}_{2 e}$
$\qquad$ Date: $\qquad$

## Stage 5: Frosting

## Inventory Analysis

Each component used to make a cupcake has its own life cycle of production, use and waste. You will collect the values for the energy used and greenhouse gases (GHG) emitted during the production phase of each ingredient. From the ingredient cards, gather the data of each item needed to make cupcakes for your assigned stage. The information you gather should be enough to make 12 cupcakes.

Data Collection and Calculations

| You need: |  |  | Calculate This: |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Item | Amount | Unit | Energy Used | Unit | GHG emissions | Unit |
| Sugar | 800 | g | 8000 | kJ | 720 | $\mathrm{~g} \mathrm{CO}_{2 \mathrm{e}}$ |
| Milk | 5 | ml | 25 | kJ | 6 | $\mathrm{~g} \mathrm{CO}_{2 \mathrm{e}}$ |
| Butter | 240 | ml | 7920 | kJ | 960 | $\mathrm{~g} \mathrm{CO}_{2 \mathrm{e}}$ |
| Vanilla | 5 | ml | 20 | kJ | 20 | $\mathrm{~g} \mathrm{CO}_{2 \mathrm{e}}$ |
| Total |  |  |  |  |  |  |

Use this space to calculate the energy used and GHG emissions for each item.
Example: 1 egg needs 2000 kJ energy and you need 2 eggs: Energy used $=2 \times 2000 \mathrm{~kJ}=4000 \mathrm{~kJ}$
Sugar: $800 \mathrm{~g} \times \frac{100 \mathrm{~kJ}}{10 \mathrm{~g}}=8000 \mathrm{~kJ}$
$800 g \times \frac{9 \mathrm{~g} \mathrm{CO}_{2 e}}{10 g}=720 g \mathrm{CO}_{2 e}$
Milk: $5 \mathrm{ml} \times \frac{50 \mathrm{~kJ}}{10 \mathrm{ml}}=25 \mathrm{~kJ}$
$5 \mathrm{ml} \times \frac{12 \mathrm{~g} \mathrm{CO}_{2 e}}{10 \mathrm{ml}}=6 \mathrm{gCO}_{2 e}$
Butter: $240 \mathrm{ml} \times \frac{330 \mathrm{~kJ}}{10 \mathrm{ml}}=7920 \mathrm{~kJ}$
$240 \mathrm{ml} \times \frac{40 \mathrm{~g} \mathrm{CO}_{2 e}}{10 \mathrm{ml}}=960 \mathrm{~g} \mathrm{CO} 2 e$
Vanilla: $5 \mathrm{ml} \times \frac{4 \mathrm{~kJ}}{1 \mathrm{ml}}=20 \mathrm{~kJ}$
$5 \mathrm{ml} \times \frac{4 g \mathrm{CO}_{2 e}}{10 \mathrm{ml}}=20 \mathrm{gCO} 2 e$
Total energy: $8000 \mathrm{~kJ}+25 \mathrm{~kJ}+7920 \mathrm{~kJ}+20 \mathrm{~kJ}=15,965 \mathrm{~kJ}$
Total emissions: $720 \mathrm{~g} \mathrm{CO}_{2 \mathrm{e}}+6 \mathrm{~g} \mathrm{CO}_{2 \mathrm{e}}+960 \mathrm{~g} \mathrm{CO}_{2 \mathrm{e}}+20 \mathrm{~g} \mathrm{CO}_{2 \mathrm{e}}=1706 \mathrm{~g} \mathrm{CO}_{2 \mathrm{e}}$
$\qquad$ Date: $\qquad$

## Stage 6: Disposal

## Inventory Analysis

Each component used to make a cupcake has its own life cycle of production, use and waste. You will collect the values for the energy used and greenhouse gases (GHG) emitted during the production phase of each ingredient. From the ingredient cards, gather the data of each item needed to make cupcakes for your assigned stage. The information you gather should be enough to make $\mathbf{1 2}$ cupcakes.

Data Collection and Calculations

| You need: |  |  | Calculate This: |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Item | Amount | Unit | Energy Used | Unit | GHG emissions | Unit |
| Landfill paper liner | 12 | liner | 600 | kJ | 18 | $\mathrm{~g} \mathrm{CO}_{2 \mathrm{e}}$ |
| Compost paper liner | 12 | liner | 600 | kJ | -48 | $\mathrm{~g} \mathrm{CO}_{2 \mathrm{e}}$ |

Use this space to calculate the energy used and GHG emissions for each item.
Example: 1 egg needs 2000 kJ energy and you need 2 eggs: Energy used $=2 \times 2000 \mathrm{~kJ}=4000 \mathrm{~kJ}$
Landfill: 12 liners $\times \frac{50 \mathrm{~kJ}}{1 \text { liner }}=600 \mathrm{~kJ} \quad 12$ liners $\times \frac{1.5 \mathrm{~g} \mathrm{CO}}{1 \text { liner }}=18 \mathrm{~g} \mathrm{CO} 2 e$
Compost: 12 liners $\times \frac{50 \mathrm{~kJ}}{1 \text { liner }}=600 \mathrm{~kJ} \quad 12$ liners $\times \frac{-4 \mathrm{~g} \mathrm{CO}}{2 e} 1$ liner $=-48 \mathrm{~g} \mathrm{CO} 2 e$
