Soil Solarization Quiz

1. How do most farmers currently protect their crops from bugs, weeds and disease?

2. List some harmful side-effects from the current pest control practices.

3. Using the word bank provided below, fill in the blanks in the following sentence.

Soil solarization is a technique that harnesses ____________ from the sun to heat the soil and ____________ from microbes to make the soil toxic for pests to live in. Combined, these two processes rid the soil of harmful pests, ensuring the best possible crop yield.

Word Bank:
- chemicals
- acids
- radiation
- water
- bases
- power

4. Circle the variables below that can be engineered in the soil solarization process to change how well it can remove pests. Circle ALL that apply.

   Plastic type/color
   Color of glass
   Amount of water in soil  
   Area of the field
   Addition of compost
   Type of plant(s) grown
