The Power in Prosthetics Activity
Learning Objectives:

After this activity, you will be able to:

1. Explain and demonstrate the engineering design process.

2. Use the engineering design process to solve real-world problems.

3. Calculate and demonstrate sizes of measurements using a ruler (optional).
What is the Engineering Design Process?

ENGINEERING DESIGN PROCESS

ASK
to identify the need and constraints

RESEARCH
the problem

IMAGINE
possible solutions

PLAN
by selecting a promising solution

CREATE
a prototype

TEST
and evaluate the prototype

IMPROVE
and redesign as needed
**Vocabulary: Words in today’s activity**

<table>
<thead>
<tr>
<th>Prototype</th>
<th>Original type, form, or instance of some thing</th>
</tr>
</thead>
<tbody>
<tr>
<td>biomedical engineer</td>
<td>An engineer that designs biomedical equipment and devices, such as replacements for body parts</td>
</tr>
<tr>
<td>engineering design process</td>
<td>Steps that engineers follow to come up with a solution to a problem</td>
</tr>
<tr>
<td>amputation</td>
<td>An operation where a doctor has to cut off a body part because of a severe injury or infection</td>
</tr>
<tr>
<td>functional</td>
<td>Capable of serving the purpose for which it was designed</td>
</tr>
<tr>
<td>engineer</td>
<td>A person who designs, builds, or maintains engines, machines, or public works</td>
</tr>
<tr>
<td>quality of life</td>
<td>The standard of health, comfort, and happiness experienced by a person</td>
</tr>
<tr>
<td>prosthetic</td>
<td>An artificial body part</td>
</tr>
<tr>
<td>constraint</td>
<td>A limitation or a restriction</td>
</tr>

Title: My Observations

You can bullet or number your entries
Let’s Watch...

Today, we will begin our lesson by watching a quick video clip. As you are watching this video, I want you to think of at least one wondering question you have. We will share some of our wondering questions after the video.

*a “wondering question” is a question that you may have after watching the video*

The Rayna Dubose Story

I will give you a few moments to write your “wondering” question in your notebooks. We will share our questions out loud when you are done. I will write our questions down on the whiteboard.
Phenomenon

Rayna Dubose was a freshman at Virginia Tech where she had just finished her first season on the women's basketball team. Just one month after the season, Rayna fell into a coma due to bacteria meningitis and blood infection sepsis.

Because of her illness, her organs began to shut down. Gangrene, death of the body’s tissues, affected her hands and feet.

Doctors prescribed her medicine to save her life, but it could not save her arms and legs. Doctors would need to amputate both of her arms and legs.

A group of engineers were able to design prosthetics for Rayna’s legs. Rayna still needs prosthetics for her arms to maintain her quality of life.

Rayna’s doctors have come to you for your help! You are given the task of creating a functional prosthetic hand. The hand must have moveable parts to pick up a small empty Styrofoam cup, a large foam die, and a whiteboard eraser.
Research:
-I have some “grabber reacher” toys that I would like for you to look at.

-I want you to press the handles on the toys and observe how the toy is moving.

-What do you notice when you press the handle? What is causing the toy to move?

**Write at least one observation of the toy in your notebooks. You will use your observations when you begin planning your own prototypes.**
Our Activity:
Today, you and a partner will work together to build your very own prototype for a prosthetic hand for Rayna. After I place you into pairs, we will review the constraints for the activity and the materials that will be available to you to use to build your prototype. You will discuss with your partner the materials that your group will use for this activity.

I will also provide each group with a materials and planning worksheet. You will use this worksheet to draw and label your prototype. You will also have the materials listed on the worksheet. As your group collects the materials that you will use, mark or check them off on your worksheet.
Let’s review the materials: (remember to check off materials as you grab them)

<table>
<thead>
<tr>
<th>Materials</th>
<th>4 pieces of masking tape</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pre-cut hand tracings (choose cardstock, construction paper, OR cardboard)</td>
<td></td>
</tr>
<tr>
<td>scissors</td>
<td>whiteboard eraser</td>
</tr>
<tr>
<td>ruler (optional)</td>
<td>glue</td>
</tr>
<tr>
<td>thread</td>
<td>5 small colored drinking straws</td>
</tr>
<tr>
<td>large straw</td>
<td>small Styrofoam cup</td>
</tr>
<tr>
<td>large foam die</td>
<td>science notebook</td>
</tr>
<tr>
<td>pencils (2)</td>
<td>5 pieces of twine string</td>
</tr>
<tr>
<td>Latex gloves (1 per group)</td>
<td></td>
</tr>
</tbody>
</table>

Remember to grab ONLY what you will need—you don’t have to choose everything that’s available!
Constraints:

1. You MUST plan for your prototype (worksheet) and show to me BEFORE collecting materials.

2. You MUST keep track of your used materials by checking them off on the planning worksheet OR recording them in your science notebook.

3. For your prototype, you may choose cardboard, cardstock, OR construction paper (cannot choose more than one).

4. You may only use the selected amount of materials listed (for example, you CANNOT use more than 4 pieces of masking tape).

5. Materials that are listed as “optional” will be used as needed (you cannot use an extreme amount).

6. You MUST record your observations in your notebooks.
Let’s Begin...

1. You will be paired into groups of two. If there is an odd number, one group may have three members.

2. Begin planning your prototype on your planning sheet. Remember to label your drawings and record all observations in your notebooks.

3. While planning, discuss within your groups what materials you will need.

4. When your plan is complete, raise your hands so that I can review your plan BEFORE you grab your materials. Remember to keep track of the materials that you use.
Testing:

1. After building your prototype, you will test it to see if it is functional.

2. You will test your prototype by using it to pick up a small, empty Styrofoam cup, a foam die, and a whiteboard eraser.

3. After testing, remember to record your observations in your notebooks.

4. If your prototype fails testing (if it cannot pick up most or all items), discuss with your partner improvements that should be made to your prototype to make it functional.

5. If your prototype passes testing, discuss within your groups what made your prototype successful, then record your successes in your notebooks.

Remember to discuss improvements with me before making them. Improvements should also be noted in your science notebooks!
Reflections:
- You will complete a reflections activity after testing/making improvements to your prototype (to be completed by each student).

- Remember to discuss each question with your partner before recording your answers.

- Reflections will be turned in when complete.
Sharing:
- Each group will present their prototype to the class (this includes sharing observations that were recorded in your science notebooks)
- Groups will also share any improvements that were made to their prototype
- Students will use a rubric to evaluate their peers

A rubric is a guideline used to evaluate an activity.
Any Questions:

READY, SET, BUILD ENGINEERS!!
Protocol: \textit{(a system of rules that explain the correct conduct and procedures to be followed for an activity)}

1. Paired into groups

2. Review materials your group will use (record reasonings in your notebooks)

3. Begin planning for your prototype (record any observations in your notebooks)—SHOW TO THE TEACHER WHEN COMPLETE!!

4. Grab your materials (remember to keep track of materials used)

5. Begin building your prototype from your plan (record observations!)

6. Test your prototype (record observations)—SHARE YOUR RESULTS WITH THE TEACHER

7. Make improvements if needed (record improvements in your notebooks!)

8. Complete the reflection activity

9. Share your prototype and observations with the class

10. Complete exit ticket
Let’s Discuss...
During today’s activity, how did you...

- Ask to identify the need?
- Research the problem?
- Imagine possible solutions?
- Plan by selecting a solution?
- Create a prototype?
- Test the prototype?
- Improve and Redesign?

Questions?
Exit Ticket:

Use the descriptions in the box to complete each statement by writing them on the blank lines.

Turn in your exit tickets when complete.
