DAY 2 (45 MINS)

JIGSAW LABORATORY RESEARCH

Goal: Learn how salt, sugar, and pepper dissolve in water.

Assignment: Each table group person gets a different station.

Time: 20 minutes for data collection.

Collaboration: Work with others at your lab station.

Reporting: Share findings with your original table group.

 Person 1: Concentration	 Person 2: Surface Area
 Person 3: Temperature	 Person 4: Agitation

4 TOTAL RESEARCH STATIONS

Investigation 1: Increasing Amount of Salt, Sugar, and Pepper

Investigation 2: Changing Size of Sugar, Salt, and Pepper

Investigation 3: Increasing Temperature of the Water

Investigation 4: Increasing Time of Agitation (Amount of Stirring)

LAB SAFETY

Investigation 1: safety goggles, hair back, sleeves up

Investigation 2: safety goggles, hair back, sleeves up

Investigation 3: safety goggles, hair back, sleeves up, heat-protection gloves, teacher supervision

Investigation 4: safety goggles, hair back, sleeves up

AQUEOUS SOLUTIONS RESEARCH

1. Put the safety glasses on and tie your hair back.
2. Grab a **Data Sheet** and read it front to back aloud with your group.
3. Assign 1 person the “**Lab Manager**” role. They will read the **instructions for each step of the lab.**
4. Assign the other people to work on salt, sugar, and pepper. Try to make even groups.
 - i. *2 people will work on salt research.*
 - ii. *1 will work on sugar research.*
 - iii. *1 will work on pepper research.*
5. The salt research should be conducted first. While that person is conducting and listening to the Lab Manager, the other students will observe what is happening to the salt. In the **Observations** box, record how well the salt dissolves each step of the way. Be as detailed as possible.
6. After the salt research is complete, **record a summary of what you just learned about salt and Concentration in the “Explain” box.**
7. Repeat Steps 6-7 for both sugar and pepper.
8. Verbally share your results with the people at your table, and make sure everyone has the information on their data sheets. **Call your teacher over to confirm if your data is correct.**
9. Clean the lab before returning to your original group of 4.

Aqueous Solutions JIGSAW Key Patterns

How well did the SALT dissolve?	
Station 1	As concentration (amount of salt) increased....
Station 2	As surface area increased (as the size of the salt got smaller)
Station 3	As temperature of the solvent (water) increased...
Station 4	As agitation (amount of stirring) increased...

 Person 1: Concentration	 Person 2: Surface Area
 Person 3: Temperature	 Person 4: Agitation

JIGSAW Research Roles

SHARING YOUR FINDINGS

In numerical order, take turns verbally sharing your findings with your **jigsaw group of 4**.

How did your station help (or not help) dissolving the following solutes:

- Salt
- Sugar
- Pepper

RESEARCH CLASS DISCUSSION

Your group be assigned one of these questions. You have 5 minutes to prepare an answer. Be prepared to share your answers with the whole class.

1. What helps sugar dissolve the best?
2. What helps salt dissolve the best?
3. What patterns did you notice about pepper in the lab?
4. How does this relate to rare earth elements?/mining?
5. Why is the problem with mining hard to solve?
6. Why did we choose salt, water, sugar, and pepper instead of acid and REEs?
7. How will we use this information?

KEY VOCABULARY

Solubility - The ability of a substance (solute) to form a solution with another substance (solvent)

Aqueous Solution -
Solvent is water

KEY VOCABULARY

'Water Fearing'

These objects do not like water and do not mix with water.

'Water Loving'

These objects like water and like to mix with water.

KEY VOCABULARY

When hydrophilic salt and sugar completely mix with water, you can no longer see the particles. This means they went **into solution**.

Hydrophobic pepper won't mix with water. It can still be seen despite agitation. This makes it a **mixture**.

SOLUBILITY GRAPH

On your personal copy of this graph, annotate:

What I see...

What it means...

SOLUBILITY CONSENSUS

1. Temperature:
2. Concentration:
3. Agitation:
4. Surface Area of Solute:
