## **Ambulance Engineering Design Project Packet**

**Client Statement (Engineering Challenge)** 

Here at E.G. Benedict Ambulance Company, we pride ourselves in providing the most up-to-date, cutting edge, emergency response vehicles available. Through discussions with our customers, we have identified patient safety during transport as a major concern. This has become a

new focus for our development group. We would like you to design a patient safety syste

would like you to design a patient safety system for our next-generation ambulance. This safety system may be limited to the safety restraints, or include vehicle modifications. Patient safety is our number one goal.

**Problem Statement** (A detailed description of needs to be met.)

Name:	Date:	Class:
Functions (What the design project/product will do.)		
<b>Constraints</b> (The design criteria that MUST be met to be	oe considered acceptable	and successful.)
Background Research		
For homework, use the internet to researce patient restraints, how seatbelts work and		
keep a record of relevant information and	· ·	
Possible Design Solutions		
For homework, on a piece of graph paper,	sketch three possi	ble design solutions.

Then, with your group, discuss each design with team members. Create a pro and con T-chart for each design. *Tip:* Create your T-charts on the same paper as your

designs so you are less likely to lose them.

Destruit des Constitutions		

**Prototype Creation** (describe your selected design and why you chose the design you did)

## **Prototype Testing**

- 1. Place the model patient (a raw egg) into the prototype ambulance.
- 2. Adjust the ramp angle to level 1 (back of ramp is set on 1 milk crate).
- 3. To simulate a front-end collision, roll the ambulance prototype down the ramp into the wall.
- 4. If the raw egg does not crack, the patient survived. Proceed to increase the ramp height by adding 1 additional milk crate and repeat the test.
- 5. Continue increasing the ramp height and testing until the patient does not survive or 5 milk crates have been used.

**Test Results** (Description of test results, facts only)

## Example results:

Level 1: The egg did not move during the collision testing.

Level 2: The egg shifted to the front of the restraining belts, but did not slide out completely.

Level 3: The egg slipped out of the restraining belts and broke when it hit the

floor. "Patient" did not survive. End of testing for this prototype.

Level 4: Unable to test.

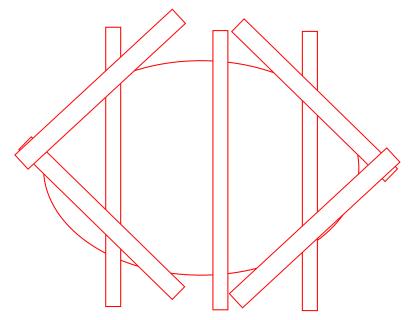

Level 5: Unable to test.

Name:	Date:	Class:	

**Evaluation of Results** (Based on the test results was your design effective? How do you know?) *Example answer:* Based on our group's test results, I feel that our prototype ambulance was very successful. Our design was able to keep the egg/patient from breaking at both level 1 and level 2 collisions. Unfortunately, during the level 3 collision test, our egg slid out of the restraints and broke.

**Future Recommendations** (Based on the test results and your evaluation of the results, what you would recommend for improvements to your design, why would you make the described changes) *Example answer:* For the design of the next generation of the ambulance, I suggest a change to the passenger safety restraints. The current design uses three straps across the patient. I recommend adding straps that form V-shapes at the top and bottom of the patient. These V-shaped straps would be in addition to the existing straps to hold the passenger more securely while experiencing the forward and backward forces of front-end collisions.

## Sketch your recommended design changes in the space below:
